

12/18/20 Update: **Algae Bloom in the Lagoons**

We want to thank residents for their understanding as we continue to monitor, sample, and map the algae blooms in the waterways. Since the flyer was sent out, we have received preliminary feedback obtained from testing laboratories that the algae bloom is possibly “Green Nanophytoplankton” and most likely not toxic or has a very low/undetectable toxicity, however, we do not know why the red discoloration particularly in the North Lagoon. We are still working on identifying the exact species of the algae. And once we know the exact species, we will update information relative to best management practices. The North Lock and Calypso Shores boat ramp have been reopened for resident use. As we continue to monitor and out of an abundance of caution, we will keep in place the recommendation set in the previous flyer you received (see below for details). We will continue to add update to the website as we find out more.
